

WHAT IS CLAIMED IS:

1. An arrangement for resealing a beverage container having a top with an aperture that can be opened to discharge the beverage, the arrangement comprising:

5 a main cap for engagement over the beverage container top for covering the beverage container top;

10 a seal member hermetically connected to the main cap and extending toward the beverage container when the main cap is over the beverage container, the seal member having a pressure sealing portion adapted to engage against and hermetically seal with the beverage container, for resealing the aperture, the sealing portion being positioned and shaped so that pressure from the beverage container presses the sealing portion against the container to increase the hermetic sealing effect;

15 locking means connected to the main cap for removably fixing the main cap to the beverage container with sufficient force to resist pressure from, and to maintain pressure in the beverage container;

20 an opening through the main cap for discharging beverage from the beverage container; and

25 a secondary cap removable engaged with the main cap for closing the opening through the main cap with sufficient force to resist pressure from, and to maintain pressure in the beverage container.

30 2. An arrangement according to claim 1, for beverage containers having an outer bead on the beverage container rim, the locking means comprising latch means for engaging the bead.

3. An arrangement according to claim 2, wherein the

0934400-081501

locking means for engaging the bead comprise at least one arcuate hook for engaging under the bead and means for resiliently moving the arcuate hook for engaging under and disengaging from the bead.

5           4. An arrangement according to claim 1, wherein the  
locking means comprises an enclosure having an open top  
for receiving the beverage container, and engagement means  
between the main cap and the enclosure for removable  
10       fixing the main cap to the enclosure, and with sufficient  
force to resist pressure from, and to maintain pressure in  
the beverage container.

5. An arrangement according to claim 4, including  
means for insulating the enclosure.

15           6. An arrangement according to claim 1 wherein the  
beverage container includes a rim with an inner surface  
extending at an angle to an axis of the beverage  
container, the pressure sealing portion being annular and  
having an outer surface which, with the main cap engaged  
over the beverage container, lies at least partially  
20       against the inner surface of the rim.

7. An arrangement according to claim 6 wherein the  
main cap includes an inner rim for engaging at least an  
upper part of the outer surface of the annular pressure  
sealing portion, the inner rim extending partially toward  
25       the inner surface of the can rim with the main cap engaged  
over the beverage container.

8. An arrangement according to claim 1 wherein the  
beverage container includes a tab for opening the top of

09931400-081501

the beverage container, the main cap including a portion with an edge shaped to engage under the tab to help lift the tab and open the beverage container.

5 9. An arrangement according to claim 2 wherein the locking means comprise a pair of pivotally connected latches on opposite sides of the main cap, each having a lower portion for hooking the outer bead and upper projecting portions.

10 10. An arrangement according to claim 9 wherein the secondary cap has an outer diameter for engaging behind the upper projecting portions to prevent the latches from pivoting when the secondary cap is in a position to close the opening through the main cap.

15 11. An arrangement according to claim 9 wherein the secondary cap has an inner diameter for engaging around the outer surface of the latches for keeping the latches locked to the bead.

20 12. An arrangement according to claim 9 wherein each lower portion of the latches has a hook which extends around at least part of a circumference of the beverage container rim.

13. An arrangement according to claim 12 wherein each latch extends around about 90°-180° of the circumference of the bead.

25 14. An arrangement according to claim 12 wherein the main cap comprises a latch member which carries the latches, and a seal support member which carries the seal

member, the latch member and the seal support member, being connected to each other to form the main cap.

5 15. An arrangement according to claim 14 wherein the latch member includes a cylindrical portion and a platform extending in the cylindrical portion, the platform having an aperture therethrough for receiving part of the seal support member, and a plurality of slots extending in the cylindrical portion for defining at least one live hinge between the latches.

10 16. An arrangement according to claim 15 including grooves in the platform for defining part of the live hinge.

15 17. An arrangement according to claim 15 wherein the seal support portion has a conical projection which is hollow and which carries the opening through the main cap, the aperture in the latch member having at least one conical portion for locking the conical projection to fix the seal support member to the latch member.

20 18. An arrangement according to claim 1 wherein the sealing portion is annular and flexible.

19. An arrangement according to claim 18 wherein the annular flexible sealing portion extends downwardly and inwardly with respect to the main cap.

25 20. An arrangement according to claim 19 wherein the annular flexible sealing portion is positioned and shaped to engage onto the top of the beverage container.

09931400-031501

21. An arrangement according to claim 19 wherein the annular flexible sealing portion is positioned to engage into a groove around the top of the beverage container and against the inner surface of the rim of the beverage container.

22. An arrangement for resealing a beverage container having a top with an aperture that can be opened to discharge the beverage, and a rim with an inner surface, around the top, the arrangement comprising:

10 a main cap for engagement over the beverage container top for covering the beverage container top;

a seal member hermetically connected to the main cap and extending toward the beverage container top when the main cap is over the beverage container top, the seal member having a sealing portion adapted to engage against and hermetically seal with the beverage container;

15 an enclosure having an open top for receiving the beverage container, with engagement means between the main cap and the enclosure for removable fixing the main cap to the enclosure with sufficient force to resist pressure from, and to maintain pressure in the beverage container;

20 an opening through the main cap for discharging beverage from the beverage container; and

a secondary cap removable engaged with the main cap for closing the opening through the main cap with sufficient force to resist pressure from, and to maintain pressure in the beverage container.

23. An arrangement according to claim 22 wherein the enclosure is insulated.

30 24. An arrangement according to claim 23 wherein the

09931400-081501

engagement means comprises a thread engagement between the main cap and the enclosure.

5        25. An arrangement according to claim 24 wherein the sealing portion is annular and is positioned to engage into a groove on the top of the beverage container which is at the base of the inner surface of the rim.

10       26. An arrangement according to claim 24 wherein the sealing portion is annular and is positioned to engage against the top of the beverage container at a location inwardly of the inner surface of the rim.
